 - There will be no APIs used
-

Component Map:

Sitemap:

Database Organization:

Account		
TEXT	username	PRIMARY KEY Identifier for each account.
TEXT	password	Password for each account.
LIST	To-Do Lists	The account's saved todo lists
TEXT	Default Settings	The account's default settings on how the todo lists are sorted

List		
TEXT	title	Title for an entry into the to-do list.
TEXT	description	Description for an entry into the to-do list.
DATETIME	created	Time an entry was made.
DATETIME	due	OPTIONAL Time an entry is due.

API Section:

We are not going to use an API.

Frontend Framework:

Tailwind will provide us with much more flexibility to build our own styled elements and components compared to other frameworks, it'll allow us to create much more unique designs for our todo list website.

JavaScript will provide us with the ability to sort our todo lists based on user input without having to reload the page. It would also allow us to have fun animations with the todo list.

- Nav-bar: a nav bar that will provide linkages to user profile, homepage, login/register, logout, and create new to-do list entries

- Sign-in/Sign-out: login card, reusable so that it will cover the login/logout pages, and also ideally be callable whenever necessary
 - Animations/Sort: make our website look good through small visual effects and be able to sort our todo list, and ideally have a clean and comprehensible todo list website
-

Task Breakdown:

- Python Flask Scripting (Ricky)
 - Create routes to the frontend and handle user input
- HTML Templates Design (Ricky)
 - Create Frontend Framework and Structure
- Python DB (Jalen)
 - Creates the DB to store data and handles access of data
- Page Design (Jalen)
 - Modify HTML Templates by using CSS/Tailwind
- Page Design (Ricky)
 - Modify HTML Templates by using JavaScript
